ECE and Materials Departments
UCSB

The convergence of research and innovation.

- **Early tunable laser results**
 - vernier-tuned coupled-cavity lasers
 - DBRs
 - SGDBRs (vernier-tuned DBRs)
- **Other widely-tunable laser designs**
- **Recent advances**
- **Photonic ICs developed from (and including) tunable laser technology**
- **Heterogeneous Integration**

- Change m , n or L to tune λ

- Tune n_1 or n_2 to tune wavelength location of reinforced modes
- Also possible with coupled ring cavities
- Can provide enhanced AM or FM capability (ISLC '84)

Next: Combine vernier tuning with DBR mode selection and continuous tuning?

- Coupling mirrors between integrated active and passive sections

→ Etched grooves

- Tunable single frequency
- Laser-modulator
- Laser-detector

NOTES:

DO NOT AFFIX OVERLAYS ALONG THIS SURFACE

ISLC '84, with T. Koch

RIE etch, Regrow InP, HCl etch

- Tune cavity modes and selection filter separately (or together)

- The center wavelength of grating, λ_g , will tune in direct proportion to the index change Δn_{DBR} ; however this will also tune the mode slightly as well, due to the penetration, L_{eff} .
- Tuning the Phase section electrode will tune only the mode location, λ_m , (tune together with DBR for wide continuous tuning: *JQE 23* (6) 903, June, 1987)
- There also may be some slight active region index change (due to loss changes)

$$\frac{\Delta \lambda_g}{\lambda_g} = \frac{\Delta \bar{n}_{DBR}}{\bar{n}_{DBR}}.$$

$$\frac{\Delta \lambda_m}{\lambda_m} = \frac{\Delta \bar{n}_a L_a + \Delta \bar{n}_p L_p + \Delta \bar{n}_{DBR} L_{eff}}{\bar{n}_{ga} L_a + \bar{n}_{gp} L_p + \bar{n}_{gDBR} L_{eff}}.$$

- Combine vernier with DBR

[57] ABSTRACT

An improvement for allowing selective tuning of the emitted beam over a broad bandwidth to a diode laser

having an active section for creating a light beam by spontaneous emission over a bandwidth around some center frequency and for guiding and reflecting the light beam between a pair of mirrors bounding the active on respective ends thereof to create an emitted beam of laser light. The mirrors each have narrow, spaced reflective maxima with the spacing of the reflective maxima of respective ones of the mirrors being different whereby only one the reflective maxima of each of the mirrors can be in correspondence and thereby provide a low loss window at any time. The preferred mirrors each include a plurality of discontinuities to cause the narrow, spaced reflective maxima wherein the spacing of the discontinuities of one mirror is different from the spacing of the discontinuities of the other mirror so as to cause the wavelength spacing of the maxima to be different. Additionally, the preferred embodiment includes a vernier circuit operably connected to the mirrors for providing an electrical signal to the mirrors which will cause continuous tuning within a desired frequency band, an offset control circuit operably connected to the mirrors for providing a voltage signal to the mirrors which will shift the reflective maxima of the mirrors into alignment at a desired frequency mode, and a phase control circuit for adjusting the laser mode wavelength to be in correspondence with the low loss window.

FIG. 5

FIG. 7

DESCRIPTION OF THE PREFERRED EMBODIMENT

The novel four section tunable laser of the present invention is shown in simplified form in FIG. 5 where it is generally indicated as 38. By combining discrete mode-jump tuning with continuous tuning, it will be seen that this design allows the relative tuning range to be extended by at least an order of magnitude larger than $\Delta n/n$. To achieve the objectives, two multi-element mirrors 40, 42 are employed, one at each end of the laser 38. The gain section 36 and phase shifter section 32 are as described above with respect to the three-section laser of FIG. 3, of which this is an improvement.

- 5-10X Tuning Range of DBR
- Reliable, Manufacturable InP Technology
- Can Cover C band, L band or C + L
- Easily Integrates Monolithically with Other Components (e.g. EAM, SOA)

- Initial results
- 3 sections—vernier tuning

Agility Communications formed to Commercialize in 1998.

72 nm full wavelength coverage, Agility, 2001.

SGDBR+X widely-tunable transmitter:

- Foundation of PIC work at UCSB

UCSB'90-- → Agility'99-'05 → JDSU'05→

- Vernier tuning over 40+nm near 1550nm
- SOA external to cavity provides power control
- Currently used in many new DWDM systems (variations)
- Highly reliable— < 10% of SGDBR is grating
- Integration technology for much more complex PICs

Narrow linewidth thermally-tuned SGDBR Laser

Mike Larson (TuC2)

- 70kHz linewidth and 50dB SMSR at +17dBm fiber power over 41nm range in C-band

Tunable Interferometric Transmitter (Tunit)

- Dual output Vernier tunable laser
 - 50 dB SMSR, well behaved tuning, 50nm
- Interferometrically combined modulator outputs
 - 12.5 Gbps operation, chirp control
 - 80+ km reach, SMF-28
- US Patent 9344196 (05/2016)

Fig. 1. Photograph of the device under test.

(Homodyne or Intradyne—also for Optical Synthesis)

• SG-DBR laser

- 30 mW output power
- 40 nm tuning range
- 25 mA threshold current

• 90 deg hybrid

- *1x2 MMI couplers*
- *Directional couplers*
- *Phase shifters*

No phase error
4% power imbalance

• UTC photodetectors

- **29 GHz 3-dB bandwidth with -2V bias**
- **18 mA saturation current at -5V bias.**

Homodyne OPLL + Costas Loop → 1 cm² footprint

Photonic IC: SGDBR laser, optical hybrid, and un-balanced PDs

Electrical IC: limiting amplifiers and phase & frequency detector (PFD)

Hybrid loop filter: Feed-forward technique, op-amplifier and 0603 SMDs

- BER vs. OSNR (20Gb/s to 40Gb/s)→ No ADC—No DSP
- Error-free up to 35Gb/s , $< 1.0E-7$ @ 40Gb/s
- PRBS $2^{31}-1$ signals – up to 40Gb/s
- Open eye diagrams for 25Gb/s and 40Gb/s

**1-D phased array (y-scan)
+ wavelength (x-scan)**

- Larger scale of integration, 32 channels
- Simpler layout: star coupler splitter; unequal channel length

Super modes of tunable laser

- On chip tunable laser >40 nm
- 2D beam steering demonstrated

Hybrid-Si Platform

--Vernier tuning with ring-mirrors

- Early vernier-tuned coupled-cavity laser concepts together with those of DBRs led to the creation of a four-section widely-tunable vernier-tuned design that is still in wide use today
- Many other widely-tunable laser designs have been developed over the years driven mainly by the need for a universal WDM source
- Integration technology developed for such lasers enabled many more complex Photonic Integrated Circuits
- Close integration of control/feedback electronics will be desirable in many future PIC applications
- Heterogeneous integration enables compatibility with different technologies—e.g., Si-photonics
